

iQuate launches iQSonar Oracle Edition to bring clarity to Oracle Licensing

New tool automates Oracle licence compliance and asset management

Dublin, April 28th 2010: iQuate, the IT discovery tool vendor, today announced the launch of iQSonar: Oracle Edition. Deployed centrally, this Oracle focused version of the industry leading agentless iQSonar tool allows users to rapidly discover all instances of Oracle on their IT estate and delivers detailed usage analysis to support users in managing their Oracle investment.

iQSonar is already used across complex IT infrastructures to rapidly provide an accurate picture of all IT assets. iQSonar's inherent speed means it can be used regularly across any environment to help guarantee licence compliance and control the usage, cost and management of IT assets on an ongoing basis.

"We have a 100% track record in uncovering discrepancies between actual Oracle deployment and a customer's manual inventory," said Pat Durkin, CEO, iQuate. "As a result we decided to focus on Oracle for the first technology specific edition of iQSonar. Many customers have a real and immediate need for auditing Oracle licence compliance, particularly as we enter the final weeks of Oracle's financial year. Without iQSonar, this can be a time consuming, disruptive and ultimately inaccurate process that could miss potential areas of cost saving and may, through the provision of incorrect data, result in additional software licence costs."

He added, "With iQSonar, customers get an accurate picture of their IT inventory regardless of geographical boundaries and network inconsistencies, reducing the time from one measured in months to one measured in just days."
